

Heritage Treasures: An In-Depth Analysis of

UNESCO World Heritage Sites in Tableau

CHAPTER – VI

PROJECT DEVELOPMENT

6.1 – Pre-Requisites

To ensure successful deployment, smooth performance, and easy maintenance of the "Heritage Treasures" analytics platform, several technical and data prerequisites must be met. On the hardware side, the developer and end-user workstations require a modern multi-core processor (Intel Core i5 or AMD Ryzen 5 minimum, Core i7 preferred), at least 16 gigabytes of RAM to handle fluid in-memory data operations, and dedicated graphics acceleration. These resources are essential for rendering high-density global maps and managing complex spatial interactions smoothly without performance lagging. From a software perspective, the platform strictly requires Tableau Desktop 2025.3.1 or later. This specific version contains vital optimization updates for spatial relationships, parameter workflows, and the Hyper data engine, which are necessary for the dashboards to function correctly. Additionally, the underlying operating system—Windows 11 or macOS Sonoma—must have current graphics drivers installed to fully support hardware-accelerated canvas rendering within Tableau worksheets. The data prerequisites demand a verified, high-quality copy of the UNESCO World Heritage raw datasets, including the core site registry, geographic coordinate files, and historical threat listings. The source files must be formatted in clean CSV or Excel structures, using UTF-8 encoding to preserve special characters and accent marks in international site names. Access to a secondary spreadsheet or text editor is also recommended for initial data inspections before importing the source files into the Tableau environment.
