

Heritage Treasures: An In-Depth Analysis of
UNESCO World Heritage Sites in Tableau

TEAM ID	SWTID-2026-4638
PROJECT TITLE	Heritage Treasures: An In-Depth Analysis of UNESCO World Heritage Sites in Tableau
MAX MARKS	3 MARKS

6.3 – Data Preparation

CHART NAME	CHART TYPE
Top 10 regions by area	Map
Countries per Regions	Packed bubbles
Sites Count per Region	Pie chart
Analysis of Danger sites and Areas	Bar line
Heritage ended Regions	Map
Year Forecasting	Line chart
Categories by site count	Bar chart
Top 10 danger sites.	treemap

Heritage Treasures: An In-Depth Analysis of

UNESCO World Heritage Sites in Tableau

SHEET 1

TOP 10 REGIONS BY AREA

*To get started with Canvas you need to click the New Worksheet button. Then you have to double-click the sheet tab and rename it to Top 10 Regions by Area. This is the step.

*Next you have to do something called Geographic Activation. Look for States Name En in the left-hand Data Pane under the Tables hierarchy. Make sure States Name En has a Globe Icon. If States Name En does not have a Globe Icon you have to right-click it and select Geographic Role. Then you have to select Country/Region.

*Now you need to generate the layout. Double-click States Name En. Tableau will automatically put Longitude onto Columns and Latitude onto Rows. This is how it works.

*After that you have to do something called Polygonal Fill Selection. On the Marks Card click the chart type dropdown, which currently says Automatic and change it to Map. This will turn on shapes. It is like drawing a map.

*Then you have to apply a sizing measure. Find Area Hectares in the green measures section. Drop it directly onto the Color tile on the Marks Card. Area Hectares is important here.

*You also have to apply text identifiers. Drag States Name En from the Data Pane. Drop it onto the Label tile on the Marks Card. This will create country text strings over the regions. States Name En is used again.

*To initiate filtering drag States Name En from the Data Pane. Put it directly inside the Filters Shelf above the Marks card. This is a step.

Heritage Treasures: An In-Depth Analysis of

UNESCO World Heritage Sites in Tableau

*Next you have to establish rank constraints. In the Filter wizard click the Top tab. This is where you set the rules.

*Now you have to configure filter parameters. Click the radio button to activate By Field. Set the setting to type 10 in the numerical slot select Area Hectares from the field dropdown and make sure the aggregation method is set to Sum. Then click OK. This is important for the Top 10 Regions by Area map.

*You can also edit the color palette. Click the Color tile on the Marks Card choose Edit Colors and in the palette select Teal or a desaturated blue palette. Then click OK. The color palette is up to you.

*Finally verify the boundaries. Make sure the map clearly marks out Russia, Canada, USA, Brazil, Australia, China, Niger, France, Tanzania and Kazakhstan. These are the Top 10 Regions by Area.

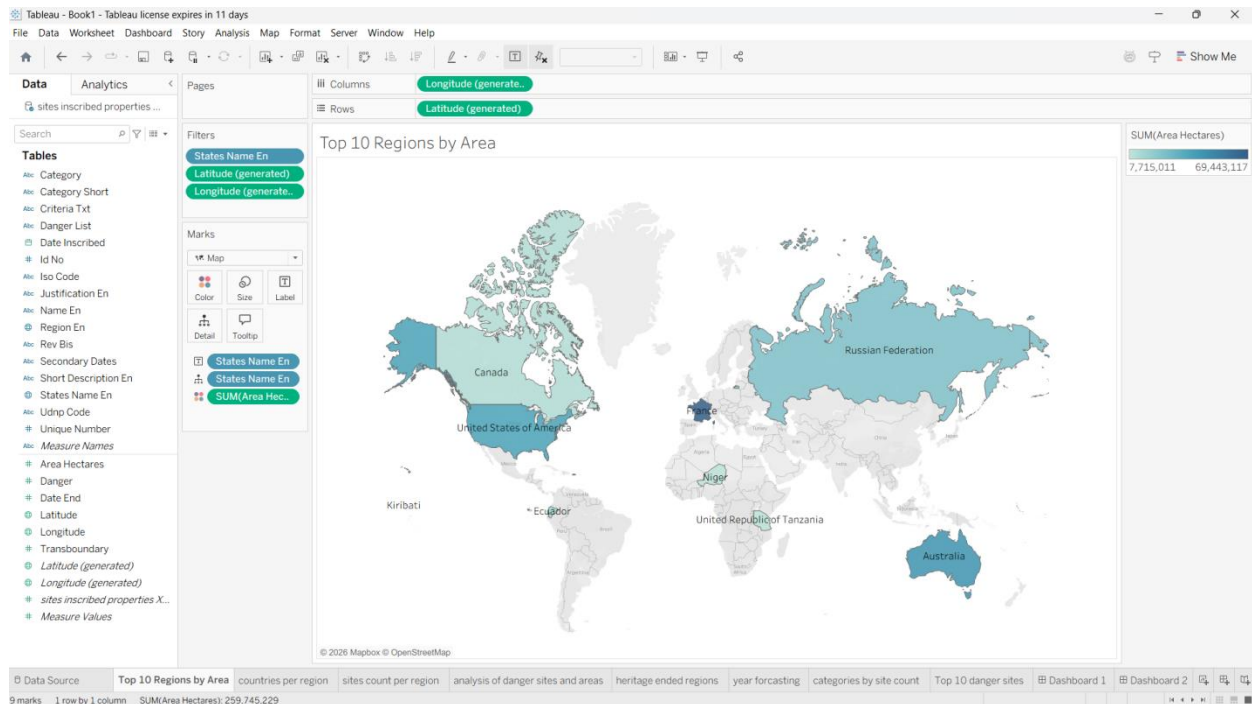

*To finish, configure label properties. Click the Label tile on the Marks Card check the box for Show mark labels and set the alignment to Center. This will make the labels look nice and neat on the Top 10 Regions by Area map. The Top 10 Regions, by Area map is now complete.

Heritage Treasures: An In-Depth Analysis of UNESCO World Heritage Sites in Tableau

SHEET 2

COUNTRIES PER REGIONS

- * Canvas Setup: Start with a worksheet and give it a name, like countries per region. Make sure the Rows and Columns shelves are empty.
- * Bulk Selection: Hold down the Ctrl or Cmd key on your keyboard. Now click on the Region En dimension. Then click on the States Name En dimension to select both of them at the same time.
- * Apply Packed Template: Open the Show Me menu at the right corner. Find the Packed Bubbles layout it looks like an icon with lots of circles of sizes and click on it.
- * Clean Up Layout: Close the Show Me menu. If Tableau added anything to the Rows or Columns shelves just drag them away to space.

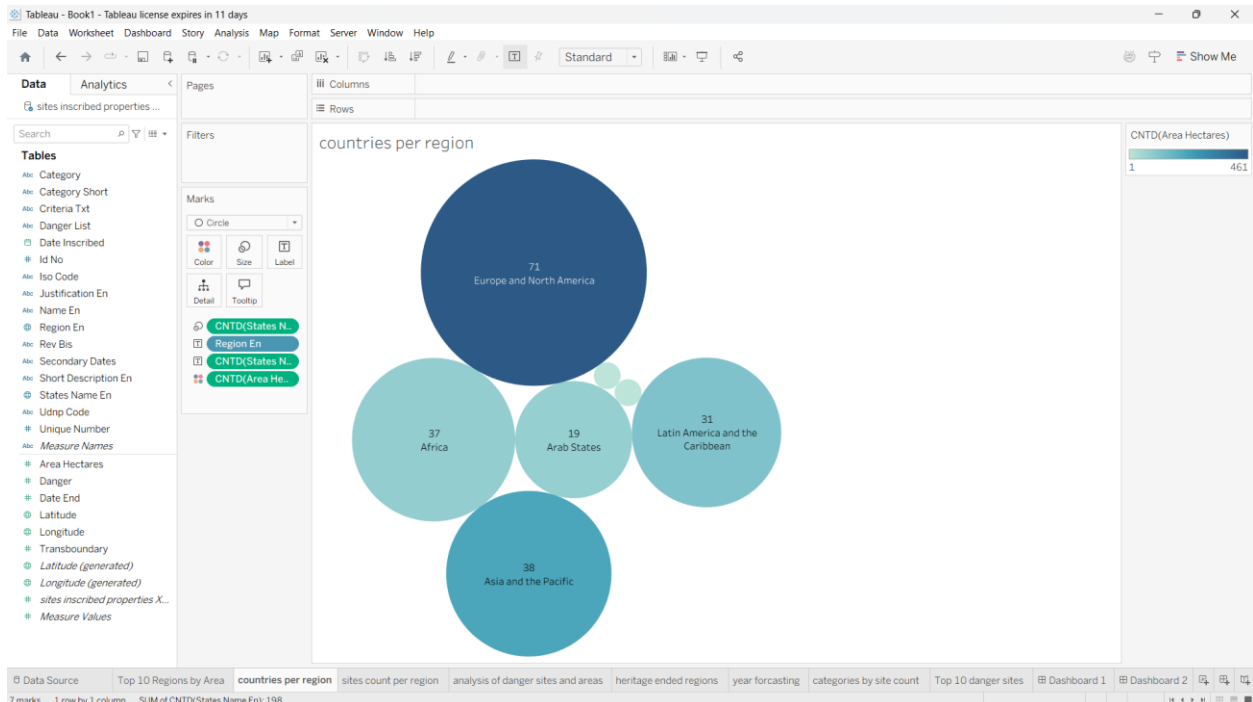

Heritage Treasures: An In-Depth Analysis of

UNESCO World Heritage Sites in Tableau

- * Ensure Correct Aggregation: Look at the Marks card. Check the field that says Size. If it says CNT(States Name En) right click on the pill and change it to Count (Distinct) or CNTD.
- * Map Discrete Colors: Make sure Region En is on the Color tile. This gives each bubble a color so they do not have a gradient effect.
- * Verify Color Legend: Check that there is a color legend on the side of the screen and it matches the regions.
- * Setup Primary Text Label: Take Region En from the Data Pane. Put it on the Label tile on the Marks Card.
- * Setup Numeric Label: Take States Name En from the Data Pane. Put it on the Label tile as well.
- * Convert Label to Distinct: Right click on the new States Name En text pill on the Marks card go to Measure and select Count (Distinct). It will change to a CNTD pill.
- * Align Text Formatting: Click on the Label tile on the Marks Card then click on the text editor button. Change the code so that <CNTD(States Name En)> is on a line, below <Region En>. Make sure the text is centered.
- * Adjust Palette Hue: Click on Color Edit Colors and pick the Seattles Grays or Winter palette to get blues and greens that look nice. Click OK.

SHEET 3

SITES COUNT PER REGION

- * Open Canvas: Start with a worksheet and give it a name like sites count per region.
- * Modify Mark Geometry: Go to the Marks Card. Find the chart type selection dropdown that says Automatic. Change it to Pie.
- * Map Slices: Find the Region dimension field in the Data Pane. Drag it to the Color tile on the Marks Card.
- * Set Slicing Metric: Look at the bottom of the Data Pane for the row count measure. It is usually called sites inscribed properties... (Count). Migrated Data Row Count.
- * Map Angular Sizing: Drag the count field to the Angle tile on the Marks Card. This will split the circle into pieces that're the right size.

Heritage Treasures: An In-Depth Analysis of

UNESCO World Heritage Sites in Tableau

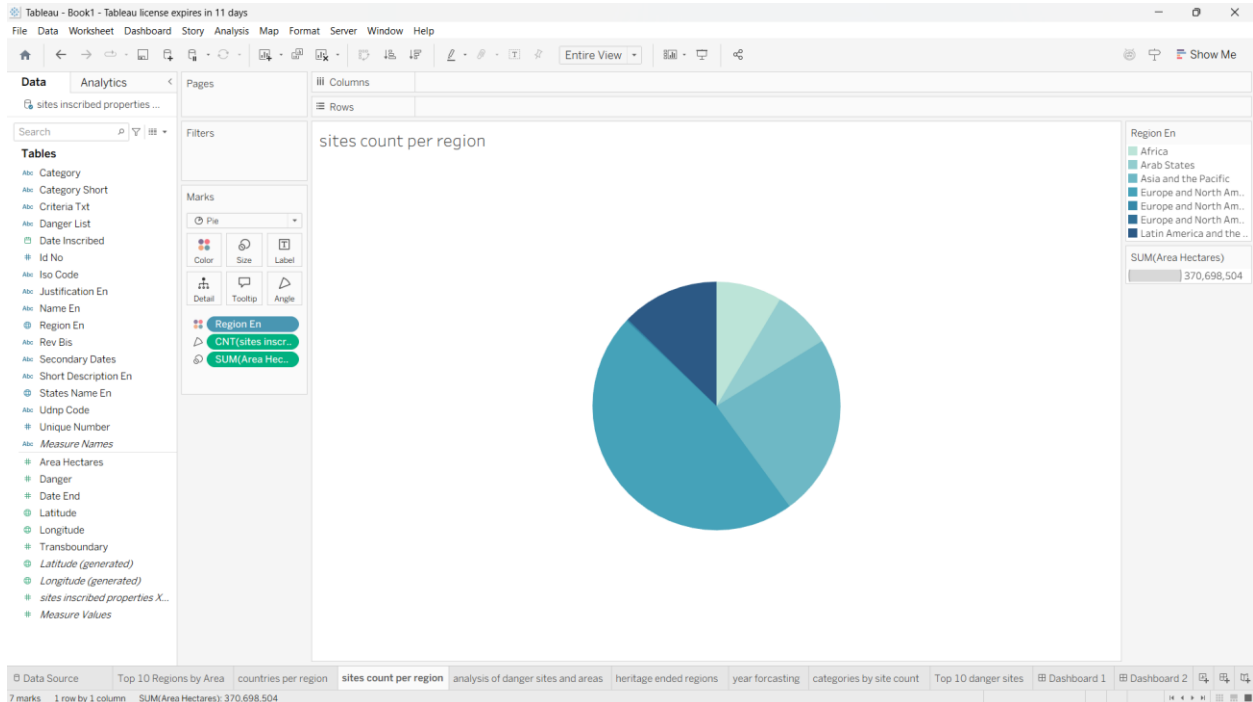

- * Integrate Land Mass Area: Find the Area Hectares field in the Data Pane. Drag it to the Size tile on the Marks Card.
- * Maximize Screen Fit: Go to the toolbar menu and find the view scale selection box that says Standard. Change it to Entire View so the pie chart fits on the screen.
- * Fine-Tune Size Scaling: Click on the Size tile on the Marks Card. Move the slider a little to the right. This will make the chart bigger.
- * Edit Legend Order: Look at the color legend on the side of the screen. If it is not right drag the items around to match the production layout.
- * Assign Color Palettes: Click on Color. Then Edit Colors. Choose a color gradient that looks nice like Classic Teal and click Apply.
- * Verify Count Aggregation: Make sure the Angle pill says CNT (Simple Count) and not SUM or CNTD. This is important to get the right row metrics, for the sites count per region.

SHEET 4

ANALYSIS OF DANGER SITES AND AREAS

- * First we need to set up our workspace. We create a worksheet. Give it a name for example analysis of danger sites and areas.
- * Next we check the date in the Data Pane on the left. The date should have a calendar icon next to it. If we see a hash mark instead we click on it. Change the data type to Date.
- * Now we create a timeline axis. We take the Date from the Data Pane. Drag it to the Columns Shelf. This shows up as a pill that says YEAR(Date) which is our date.
- * Then we map our primary volume metric. We take Area Hectares from the Data Pane. Put it on the Rows Shelf.
- * After that we map our secondary indicator metric. We take Danger from the Data Pane. Put it on the Rows Shelf next to the Area Hectares pill.

Heritage Treasures: An In-Depth Analysis of

UNESCO World Heritage Sites in Tableau

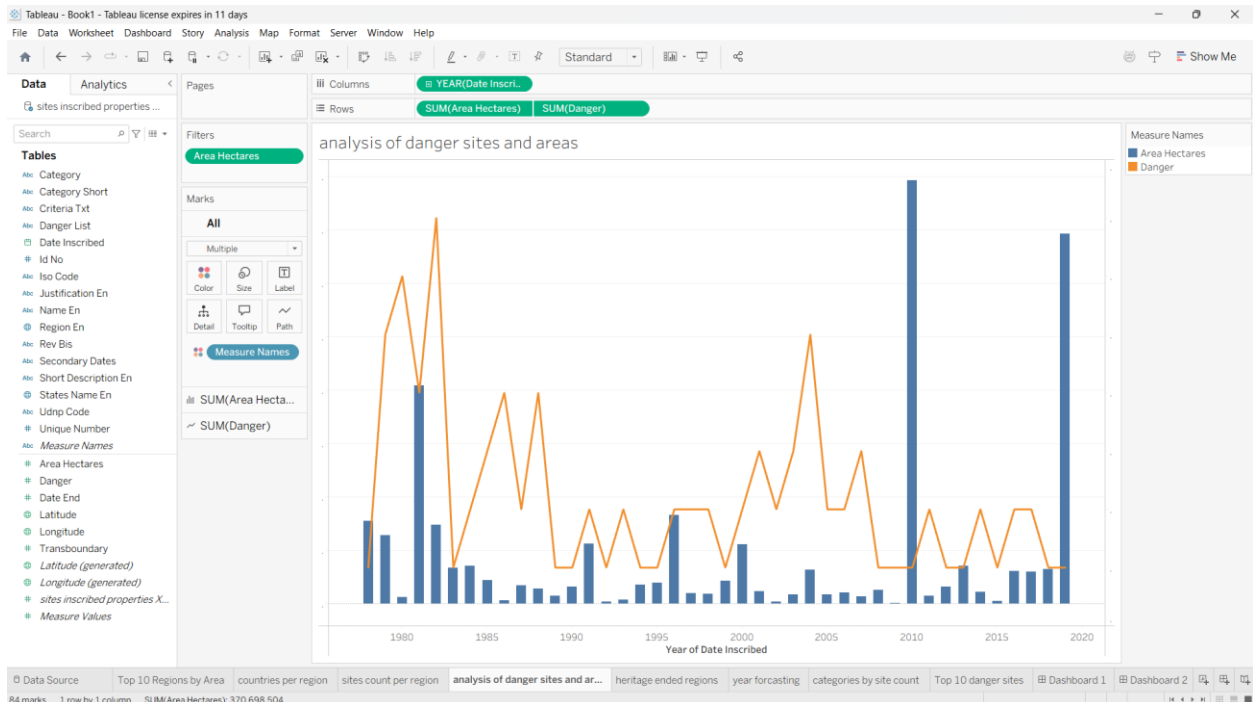

- * Now we activate the axes. We click on the Danger pill on the Rows Shelf. Choose Dual Axis from the menu.
- * Next we work on the Area Hectares layer. We look at the Marks Card. Find the part that says Area Hectares. We click on it. Change the type to Bar.
- * Then we color the Area Hectares layer. Inside the Area Hectares part we click on Color. Choose a color for our Area Hectares.
- * Now we work on the Danger layer. We go back to the Marks Card. Find the part that says Danger. We click on it. Change the type to Line.
- * Then we color the Danger layer. Inside the Danger part we click on Color. Choose a yellow color for our Danger.
- * Next we clean up our color legends. If we see a Measure Names pill, on Color we drag it away to avoid color conflicts.
- * Finally we check that our axes are synchronized. We make sure the left side of the graph shows Area Hectares and the right side shows the Danger count. Our Area Hectares axis should range from 0 to 350 million. Our Danger axis should show the Danger scale.

SHEET 5

HERITAGE ENDED REGIONS

- * Create Worksheet: Start with a canvas and name the sheet tab Heritage Ended Regions.
- * Generate Map Canvas: Find States Name En in the Data Pane. Double click it to fill the layout coordinates into Columns and Rows.
- * Convert Marks Geometry: Click the chart type selection dropdown in the Marks Card. Change it from Automatic to Map. This will fill the country borders.
- * Establish Null Filtering Constraint: Take the Date End field from the Data Pane and drop it onto the Filters Shelf.
- * Configure Filter Mode: In the Filter type dialog select All Values. Click Next.

Heritage Treasures: An In-Depth Analysis of

UNESCO World Heritage Sites in Tableau

* Apply Special Data Rules: Click the Special tab in the Filter wizard. Choose the radio button for -null values then click OK.

* Map Structural Shades: Take Date End from the Data Pane. Drop it onto the Color tile on your Marks Card. This creates a color timeline scale for the Heritage Ended Regions.

* Apply Geographic Labels: Take States Name En from the Data Pane. Drop it onto the Label tile on your Marks Card to show clear country text identifiers for the Heritage Ended Regions.

* Activate Map Backgrounds: Go to the application menu and click Map -> Background Layers to open the sidebar configuration panel for the Heritage Ended Regions map.

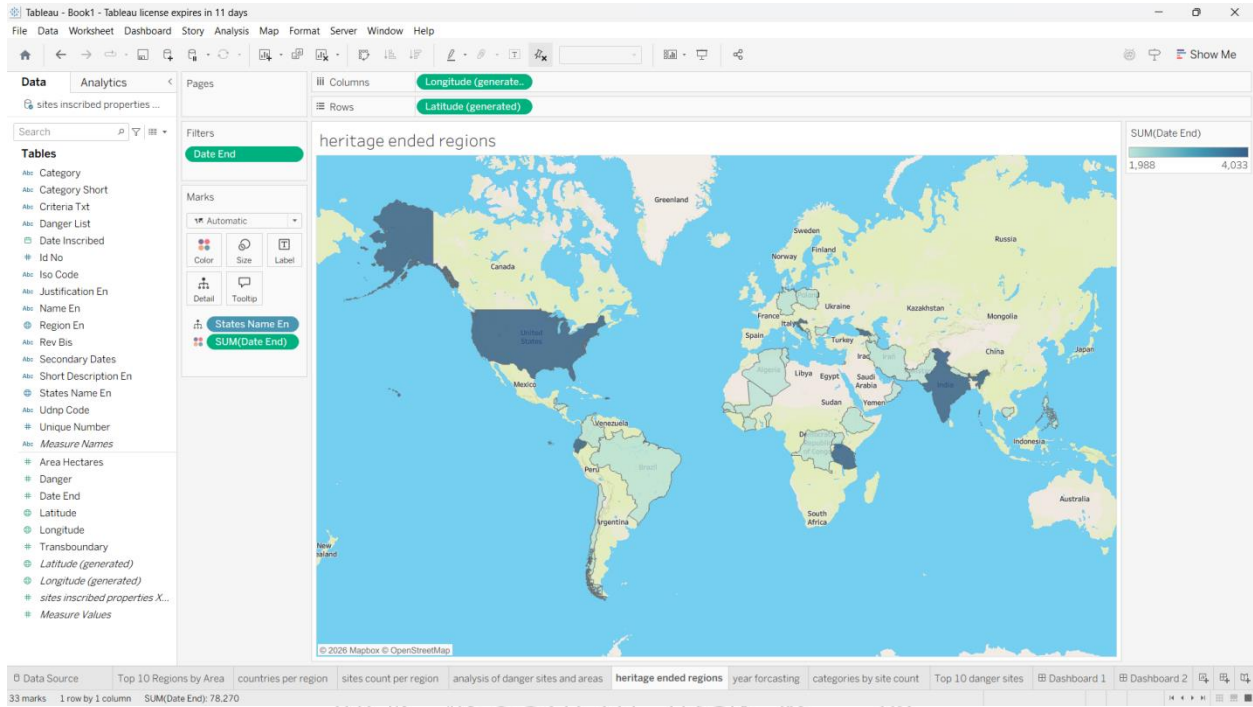

* Enforce Ocean Hues: In the background layer pane change the Style selection from Light to Normal or Outdoors for the Heritage Ended Regions map. This turns the background into a blue ocean scene.

* Clean Background Noise: Uncheck things like land borders or street layouts in the background checklist then click the small X to close the sidebar for the Heritage Ended Regions map.

* Validate Results: Check that only specific historical records, like the United States, India, Algeria and Tanzania remain visible and filled for the Heritage Ended Region.

SHEET 6

YEAR FORECASTING

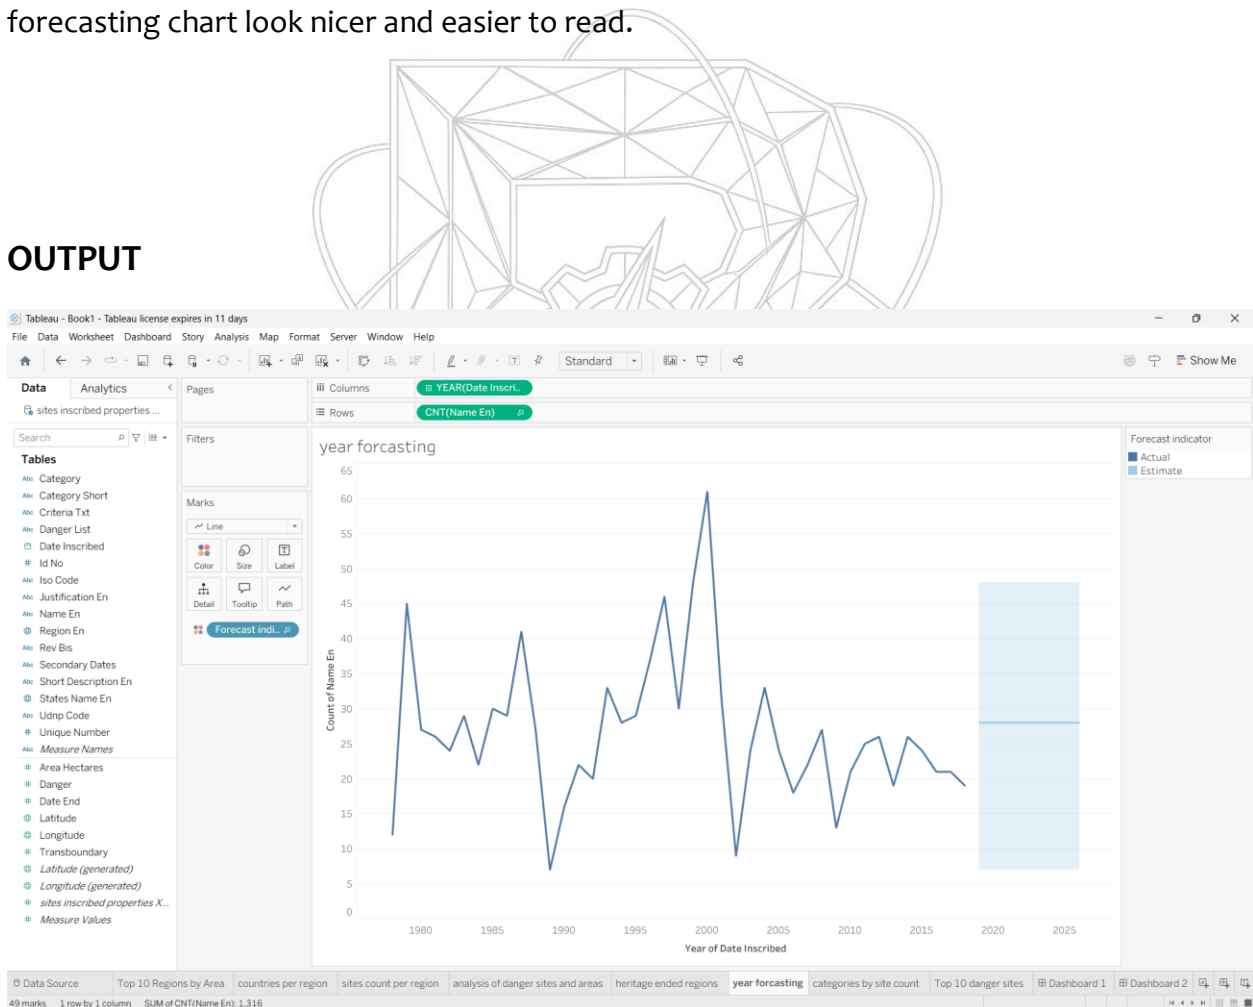

- * First you need to create a worksheet canvas and give it a title, which's year forecasting.
- * Next you have to set up the timeline axis. To do this you need to drag Date Inscribed from your Tables folder onto the Columns Shelf. You will see a pill appear on the Columns Shelf.
- * Now you have to change Date Inscribed into a chronology. You do this by clicking the Date Inscribed pill on the Columns Shelf and then you look at the selection list. You have to go past the section and select Year from the calendar option list. When you do this you will notice that the pill color changes from Blue to Green.
- * Now you need to find the dimension text field called Name En in the Data Pane.
- * Then you have to drag it and place it onto the empty Rows Shelf. This is where you map your volumetric counting for the year forecasting.
- * Next you have to convert the text rows to count metrics for the year forecasting. You do this by clicking the Name En pill on Rows and then you hover your mouse over Measure and Count. The pill will change into a CNT(Name En) item. It will plot a continuous historical line chart for the year forecasting.
- * Now you have to switch to analytics mode. To do this you look at the top of your left sidebar layout. Click the word Analytics, which is right next to the word Data to reveal the modeling tools for the year forecasting.
- * Next you have to deploy the analytics model for the year forecasting. To do this you locate the Forecast icon within the Models section click on it. Drag it out into the visualization canvas space. Then you drop it directly into the Forecast activation target box for the year forecasting.

Heritage Treasures: An In-Depth Analysis of UNESCO World Heritage Sites in Tableau

* Then you have to verify that the split elements are correct for the year forecasting. You do this by reviewing the side of your screen to ensure that Tableau has generated a Forecast indicator legend that divides the data paths into Estimate bands for the year forecasting.

* Finally you have to format the time labels for the year forecasting. You do this by clicking the horizontal year markers, across the axis and selecting Format. Then you change the Text Alignment properties to Up, which is 90 Degrees Vertical. This will make your year forecasting chart look nicer and easier to read.

OUTPUT

SHEET 7

CATEGORIES BY SITE COUNT

Heritage Treasures: An In-Depth Analysis of

UNESCO World Heritage Sites in Tableau

To start we need to set up our sheet. We will begin with a canvas layout and name the sheet tab categories by the number of sites.

* We will set up the segmentation axis by finding the Category field in our Data Pane. Then we will. Drop it onto the Columns Shelf. This will create three column buckets for us: Cultural, Mixed and Natural.

* Next we will set up the dependent volume axis. We do this by finding the country dimension field named States Name En. Then we will drag it. Place it onto the Rows Shelf.

* Now we will reconfigure the aggregation value. To do this we will right-click the green States Name En pill on Rows. Select Measure from the choices. Then we will select Count Distinct. The pill will change to CNTD States Name En.

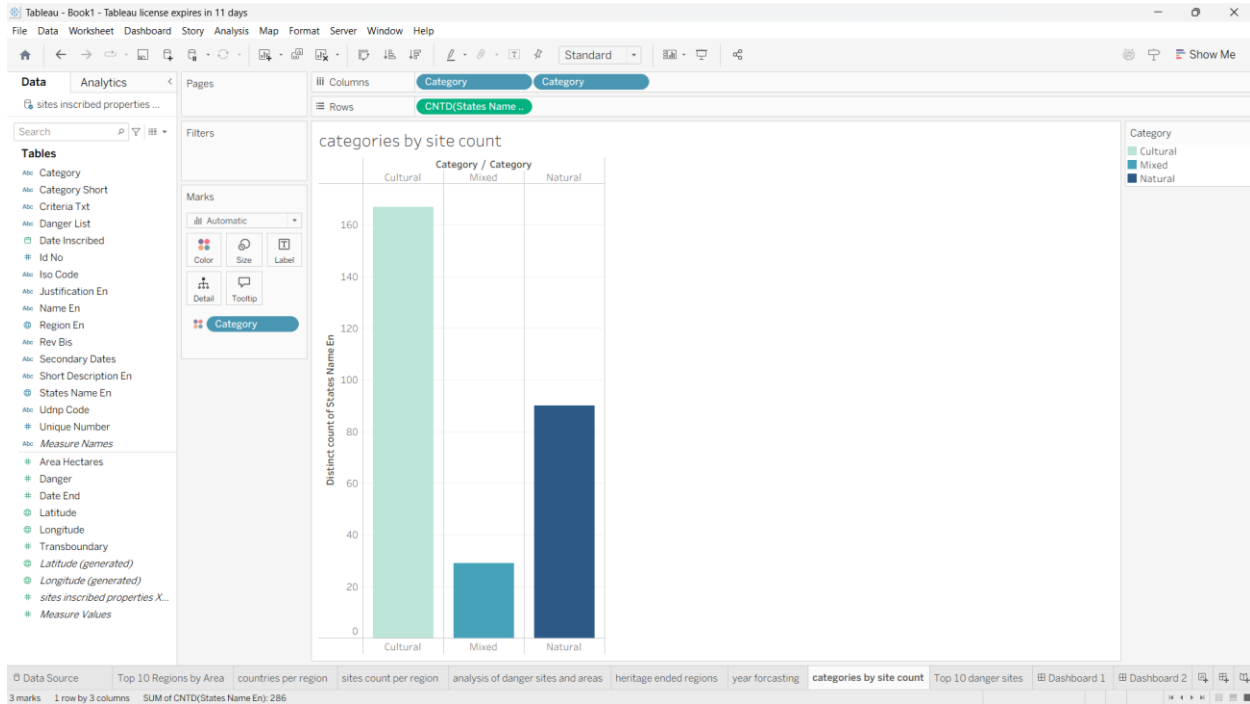

* We will establish colors for our sheet. To do this we will drag another instance of Category from the Data Pane. Drop it onto the Color tile on our Marks Card.

* Then we will configure the color shading. We will click the Color tile. Select Edit Colors. We will double-click the individual field values to assign a cool-palette sequence: we will use Light Sky Blue for Cultural, Medium Steel Blue for Mixed and Deep Cobalt Blue, for Natural. Then we will click OK.

* Finally we will configure the spacing parameters. To change the thickness of the column bars we will click on the Size tile on the Marks Card. Adjust the sliding selector scale to match our document specifications.

UNESCO World Heritage Sites in Tableau

SHEET 8

TOP 10 DANGER SITES

Open Canvas: Start with a sheet and name it "Top 10 danger sites".

* Multi-Select Structural Keys: Hold down the Ctrl key. In the Data Pane, Region, States Name and Area Hectares.

* Build Nested Structural Grids: Open the Show Me dashboard. Choose the Treemap layout.

* Verify Base Nesting: Check that Tableau put Area Hectares on Size and Color. Make sure your dimensions are on the Marks Card.

* Shatter Regions into Country Blocks: On the Marks Card put States Name on Detail or Label. This ensures big regions are divided into countries.

* Apply Ranking Filters Constraints: Drag States Name from the Data Pane to the Filters Shelf.

* Configure Rank Settings: In the filter box go to the Top tab. Select By Field. Set it to Top 10 based on Area Hectares. Click OK.

* Configure Label Layers: Drag Area Hectares to the Label tile. Add Region and States Name to the Label tile.

* Format Text Hierarchy Stack: On the Marks card click the Label tile. Click the... Button next, to Text. Clear the default text. Format it like this:

<SUM(Area Hectares)>

<Region>

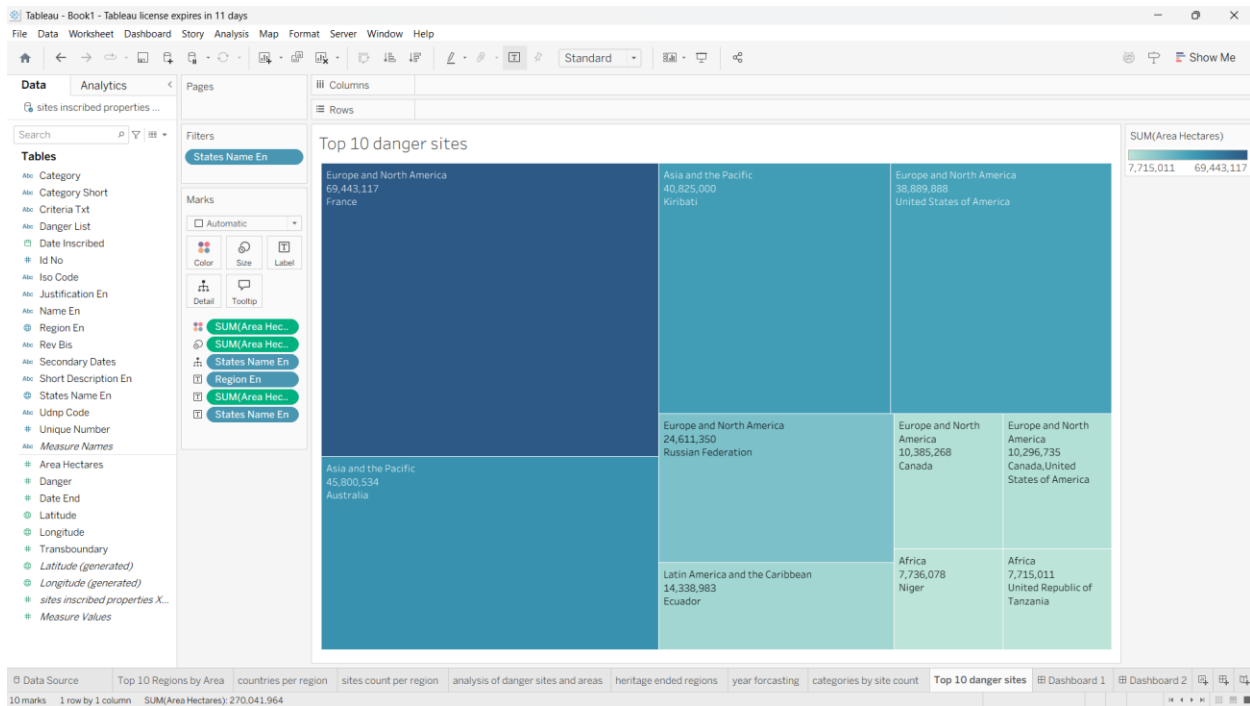

Heritage Treasures: An In-Depth Analysis of UNESCO World Heritage Sites in Tableau

<States Name>

* Save Hierarchy Settings: Click OK. The text will show area metrics, region and country.

* Set Gradient Theme: Click Color. Edit Colors. Choose a blue/teal theme. Click OK
